## **Bird Waste Removal—Exterior/Interior Cleaning Applications**

*Vapor—an environmentally friendly, effective, and safe cleaning solution.*

Large populations of roosting birds may present the risk of disease to people nearby. The high nutrient content of accumulated bird excrement (droppings) provides an excellent growth medium for organisms of potential human health concern. The most serious health risks arise from disease organisms that can grow in the nutrient-rich accumulations of bird droppings, feathers and debris under a roost — particularly if roosts have been active for years. Humans can become infected by inhaling dusts containing dried feces and wastes. External parasites also may become a problem when infested birds leave roosts or nests. These parasites then can invade buildings and irritate people.

Bird droppings that accumulate on buildings and structures can lead to the following:

- Favorable environment to the development of disease organisms harmful to humans and domestic animals
- Oxidation/Corrosion
- Unpleasant odor and appearance

**With the use of specialized air/vacuum system, bird dropping can be safely removed and disposed of. Once droppings have been removed, the work area is then cleaned, disinfected and sterilized with the use of dry vapor technology.**

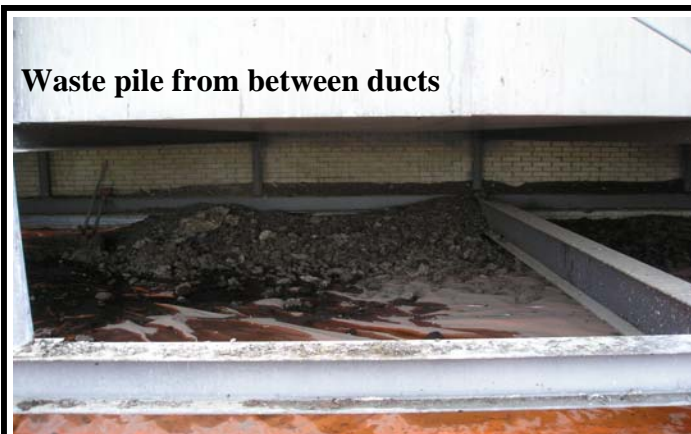

Corrosion on HVAC system due to accumulation of bird wastes.

Bird wastes removed with specialized air system.

Specialized air systems removes bird droppings from duct work. With the use of air systems (no water), disposal costs are significantly reduced. Once bird wastes are removed; steam is used to sterilize and disinfect work area.

Once bird wastes have been removed from duct work they are double bagged and sealed with the use of specialized vacuum systems and are ready for proper disposal. .
